Graduation Project Proposal Form

2025-2026

د. سنان صباح محمود (Arabic in Name Supervisor)

General Field of the Project: Electronics Engineering

Project Title: Contactless smart human thermometer for medical applications

Abstract:

This project presents designing and constructing of a contactless human temperature monitoring system using Arduino board with MLX90614 sensor. The advantage of this project is that it can measure the body temperature without making direct contact with the object being measured as well as its portability and accuracy compared to other temperature sensors.

Work Plan:

The work plan may begin by selecting and operating suitable Arduino board, connecting and operating temperature sensor module, then testing the performance on human bodies and other heated objects. In order to test its accuracy, the temperature should be measured in various situations. The result may show that the system is capable of accurately measuring a wide range of object temperature including human bodies

Requirements: (Should Provide by Student)

The hardware components used in this system include Arduino Uno, MLX90614 sensor module. The software components include a program for interfacing the fingerprint sensor with Arduino.
